Regulation of Primary Metabolic Pathways in Plants (Proceedings of the Phytochemical Society of Europe)

This book provides a timely review of progress in the area of primary plant metabolism, and in particular highlights the extent to which molecular techniques now influence the investigation and understanding of plant metabolism. The emphasis of the book is centred on processes related to the dominant pathways of carbohydrate production and utilisation, and is arranged to reflect the current focus of researchers on three broadly overlapping areas of investigation.

- The molecular architecture of selected enzymes of primary metabolism;
- The integration of metabolism between organelles, cells, tissues and organs;
- The manipulation of major pathways of carbohydrate metabolism.

Each of the contributors is an internationally recognised researcher who presents a cogent summary of recent advances in the field. The volume will be of particular value to undergraduates, graduates and advanced researchers in plant biology, biotechnology and biochemistry, as well as researchers in related areas of plant physiology, crop production and horticulture who need to keep abreast of current developments in the understanding of the fundamental aspects of plant carbohydrate metabolism.
